

# VCM

## Virtual Coordination Module

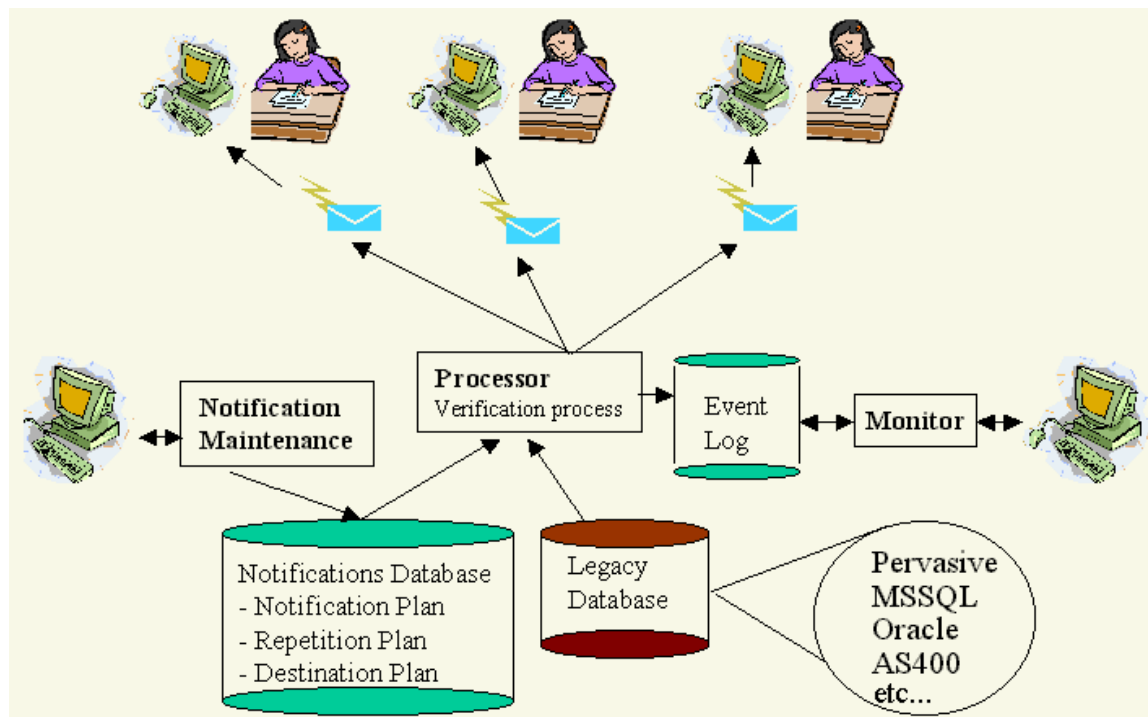

Focusing on  
what matters

### Concept

**Virtual Coordination Module (VCM)** is an innovative and focused **Solution** that can significantly help **Managing** sensitive and **Critical Business Processes**. It enables making sure that what must happen **happens on time**.

VCM will send you or others timely **Reminders** relating to events that systematically take place within your organization. These reminders can be pre-programmed to reach you or anyone on a yearly, monthly, weekly, daily or event basis.

VCM adds significant value to your existing information system. It acts as an additional resource that constantly monitors the evolution of mission critical business processes raising **Alerts** or reporting timely via email to whom it may concern about matters of significance.

Aware & Proactive

## Virtual Coordination Module

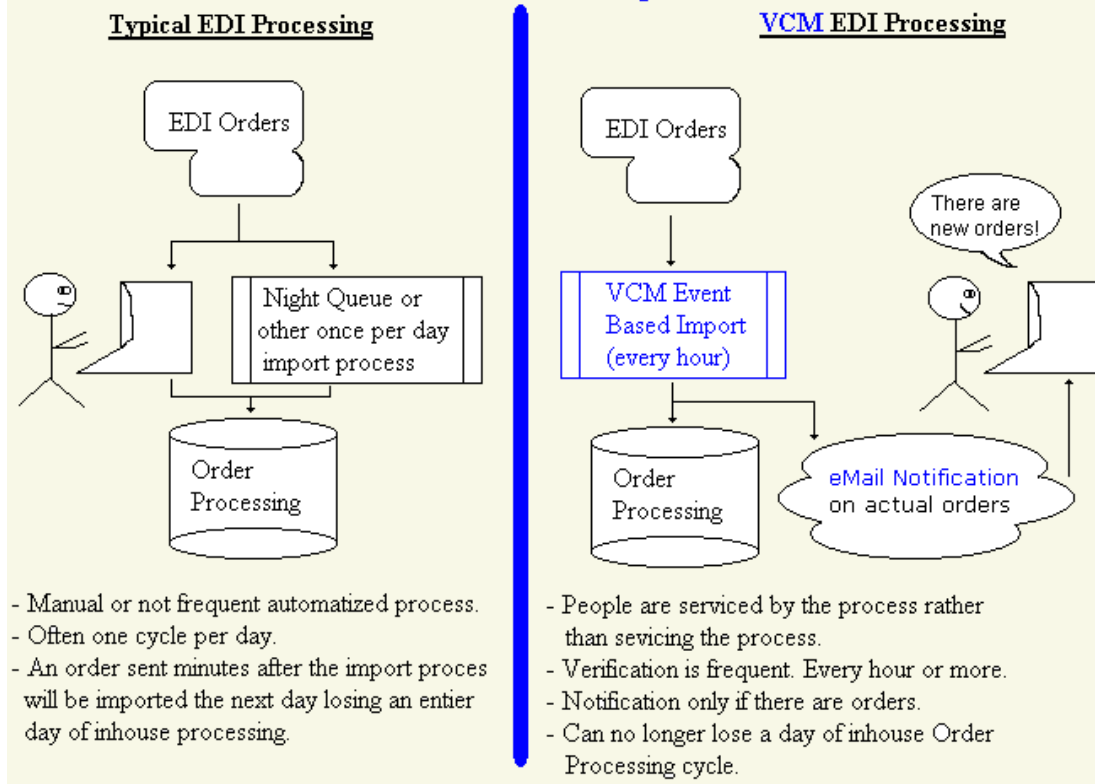

Focusing on  
what matters

### Electronic Data Interchange Example:

The EDI (Electronic Data Interchange) example shows how VCM increases efficiency by simplifying the human task required around a business process such as EDI.

Typically in many “Order Processing” systems, somebody is responsible to check on a daily basis for new EDI orders. Sometimes, a night queue process executed once a night is also helping. However, what about that big order that came in just after the verification took place? An entire business day might be lost before it is processed on the next cycle.

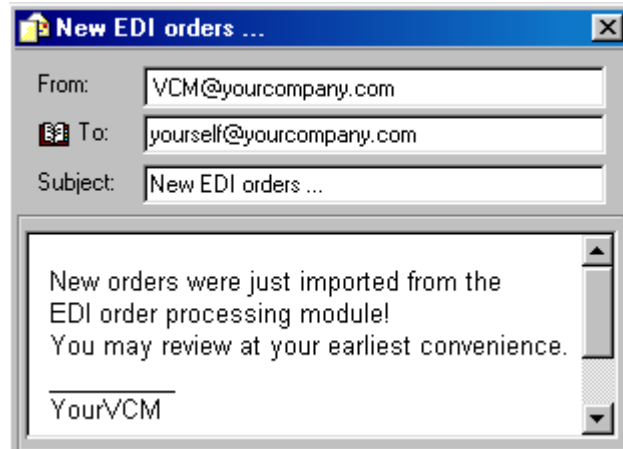

### VCM EDI Example

A VCM verification process can be easily configured to verify and actually import new orders on an hourly basis during business day. In the event of actually importing new orders, it will send an email to a responsible person notifying that new orders have come in. Notice, that in the VCM scenario, the user is serviced by the system rather than the opposite.

Aware & Proactive

From VCM:

The EDI example illustrates only one scenario of what VCM can do for you. The possibilities in your specific context are only limited by your imagination.

### **Customizable:**

VCM is leveraging RAD (Rapid Application Development) technology. This enables to quickly develop and deploy the verification processes that are of significance to your specific business situation.

Keep and capitalize on your existing solution. VCM harmoniously adapts to your current software application.

### **Integration:**

Using an Open Architecture technology developed over the last three decades, VCM will highly integrate with the current information system in place (ERP or other), sharing data and in some cases processes. Whether your current system data is MSSQL, Pervasive, Oracle or iSeries, VCM's pre-established data mining capabilities are at your service.

### **Quick and easy to implement:**

Implementation and training is a matter of hours.

Like the iceberg, the core of VCM's technology lies underneath. However, at the surface, it is very easy to operate. All that is required from most users is to be able to receive emails.

The system is deployable and fully operational on a single desktop machine and is scalable to a multi-user enterprise wide solution if required.

A graphic showing a person in a suit pointing at a screen with various colored shapes (red circle, blue square, purple triangle) floating around it.

## Features

Basic solution and initial implementation includes:

- Notification Configuration: For unlimited number of reminders.
- Processor engine: Can run 24/7/365.
- Processor Queue: To view and manage upcoming events.
- Monitor: Tracking the details of all events.
- Easy Interface to existing SMTP services for email.

## Price

VCM's cost of ownership is so small, that ROI (Return On Investment) materializes in the first few weeks and sometimes in few days following the implementation.
